EDUCATION

University of Michigan

Bachelor of Science in Computer Engineering; GPA: 3.59

Ann Arbor, MI

Expected: May '28

EXPERIENCE

Lantern AI (YC F26)

Software Engineer Intern

Hong Kong SAR

May '26 – Present

- Built Lantern Ario end-to-end as primary engineer, developing an AI meeting assistant that records and transcribes conversations, generates structured notes, and makes meeting knowledge searchable through a web application
- Connected recording, calendar, transcription, and AI services through external APIs, handling authentication and service-specific data formats while coordinating calendar events, bot scheduling, and meeting metadata across platforms
- Architected asynchronous meeting processing around webhooks and persistent jobs, tracking recordings through transcription and AI generation while preserving state and enabling recovery from interrupted or failed processing
- Prepared Ario for prospective customer use and supported product demonstration with Crypto.com; currently integrating meeting intelligence into Lantern's hiring platform for interview capture and candidate review

Atombot Research Team

Embedded Firmware Researcher

Ann Arbor, MI

Jan. '26 – Present

- Implement robotic firmware for Helium subteam focused on wheel-legged robotics, completing CAN receive and interface management functions allowing programs to issue commands, inspect controller responses, and recover cleanly between tests
- Engineer interface functions to construct, transmit, and parse custom CAN frames for robotic motor control, including command messages, state queries, and fault-code retrieval while mapping commands to required message IDs
- Bench-test and validate CAN communication with MIT ODrive motor controllers, building controlled-rotation tests and tracing message, timing, and bus-state failures until commanded torque produced consistent motor motion

Michigan Mars Rover Team

Embedded Software Engineer

Ann Arbor, MI

Aug. '25 – Present

- Redesigned rover's motor control system to enable direct communication between NVIDIA Jetson and Dynamixel servos for lower latency, simplified subsystem integration, and more responsive servo actuation
- Developed UART-based C++ wrapper around Dynamixel SDK to support direct motor control from Jetson and bridge to existing ROS 2 control nodes and interfaces, including servo configuration and state feedback
- Reworked mast gimbal hardware bridge to provide real-time position, velocity, and current telemetry, achieving $<0.1^\circ$ positioning accuracy for reliable camera operation through PID tuning and protocol debugging

Saint Louis University Dept. of Computer Science - Jie Hou Lab

Machine Learning Researcher

St. Louis, MO

May – Oct '25

- Integrated code into GraphaRNA, a PyTorch Geometric GNN designed for predicting RNA 3D structures
- Stabilized and reproduced training and evaluation on an HPC GPU node by configuring Conda, CUDA, and cuDNN paths, resolving dependency conflicts and verifying stable runtime performance across repeated runs
- Executed and monitored model training on ~3,500 RNA sequences over ~800 timesteps, validating loss convergence, checkpoint stability, and reproducibility while diagnosing unstable runs and training failures
- Migrated model pipeline from small-sequence motifs to full-sequence and stem/hairpin templates, extending dataset loader to read full and template PDBs with aligned residue and atom indexing, generating complete RNA 3D structures

SKILLS

Coursework: Operating Systems, Embedded System Design, Data Structures and Algorithms, Computer Organization, Logic Design

Programming Languages: C++, C, Python, MATLAB, TypeScript

Frameworks & Tools: Git, Linux, ROS 2, PyTorch, CUDA, React, Next.js

INTERESTS

Involvement: Michigan GeoGuessr Club, IM Soccer, Volunteer at Maize and Blue, Volunteer at Mitchell Elementary

Avid Traveler: Scuba Dived in Oahu, Biked the Shimanami Kaido, Cheered at UEFA Euro 2024

Work: Server at Hi-Pointe Drive-In, Think Camp Counselor at The Wilson School
